

# **Quantifying the Changing Age Structure of the British Electorate 2005-2025**

*Researching the age demographics of the  
new parliamentary constituencies*

**Prepared for Age Concern**

**By Dr Scott Davidson  
De Montfort University  
December 2009**

## **Introduction**

Britain will soon possess an age profile never seen before in its history, and as society ages so does the electoral register. This report details how the demographic transformation will change the age-profile of every Westminster constituency in Britain, starting with the current period and projecting into the future to see how Britain's voters will look in 2025.

This data will show how most seats in the House of Commons will elect MPs based on a turnout where grey voters are the majority. It uses the new parliamentary boundaries that will be introduced for a large swathe of seats for the first time at the next general election in 2010. Of course, none of this would be significant if older voters were identical in every way to younger voters. But as we already know, they do differ in their electoral behaviour, not least in their much higher participation rates. There are also variations in attitudes across different cohorts and generations. Furthermore, as we age our experience of society and the issues that impact the most directly on our quality of life shift and change.

This project builds and extends upon previous research published by Age Concern before the general election in 2005 that was based on quantitative data from Dr Scott Davidson and qualitative interviews with older voters in marginal constituencies conducted by Opinion Leader Research

## **The New Parliamentary Boundaries**

Constituency boundaries are determined by the Boundary Commissions for England, Scotland, Wales and Northern Ireland. Every 8 to 12 years the Commissions are required by the *Parliamentary Constituencies Act 1986* to undertake a general review of arrangements.

In general constituencies are intended to be based on local authority areas, unless a case is made to run across more than one local authority boundary. Although this is still generally the situation, there are now a significant number of seats which straddle two, sometimes three, local authority areas.

In England the general review was completed and ratified by Parliament in 2007. The review has resulted in some major changes with an increase of seats in England from 529 to 533, and the majority of constituency boundaries now being different to those used at the general election in 2005. The review for Wales was completed in 2006 and although the total number of seats remains the same at 40, as elsewhere there are some significant changes to a number of seats. Boundary changes for seats in Scotland had already been

implemented in time for the 2005 general election, and no subsequent changes are required for 2010.

### Notional Results for the New Seats

As the majority of seats in England will be fought on new boundaries at the next general election, comparisons with the results of the 2005 election become problematic – primarily because in the UK results are declared for whole constituencies without being broken up into individual ward results. In some cases a constituency may have kept the same name but will be comprised of a different set of wards with differing sets of social and political characteristics. To draw up a more useful set of data to enable comparisons with 2005 *notional* results need to be estimated - in other words, estimating how the 2005 results would have looked if votes had been counted on the basis of the new constituencies.

Of course there are limitations on how far notional results can be taken as an estimate of what *would have* happened. For example, we cannot assume that tactical voting patterns would be replicated under the new boundaries. Furthermore notional results are calculated by incorporating local authority election results to obtain a *multiplier* for each party, but these calculations are done in the knowledge that some voters do not replicate their national voting habits at local level contests.

However, with these caveats in mind the notional results provide us with a very useful model for evaluating the new political geography created by the boundary reviews.

This research is using the notional results calculated by Rallings and Thrasher at the Local Government Elections Unit at Plymouth University. These estimates are widely used and respected by the research community. Their estimates will also form the basis of the election reporting for the Press Association, the BBC, ITN and Sky News and are publicly available at: [election.press.net/constituencies.html](http://election.press.net/constituencies.html)

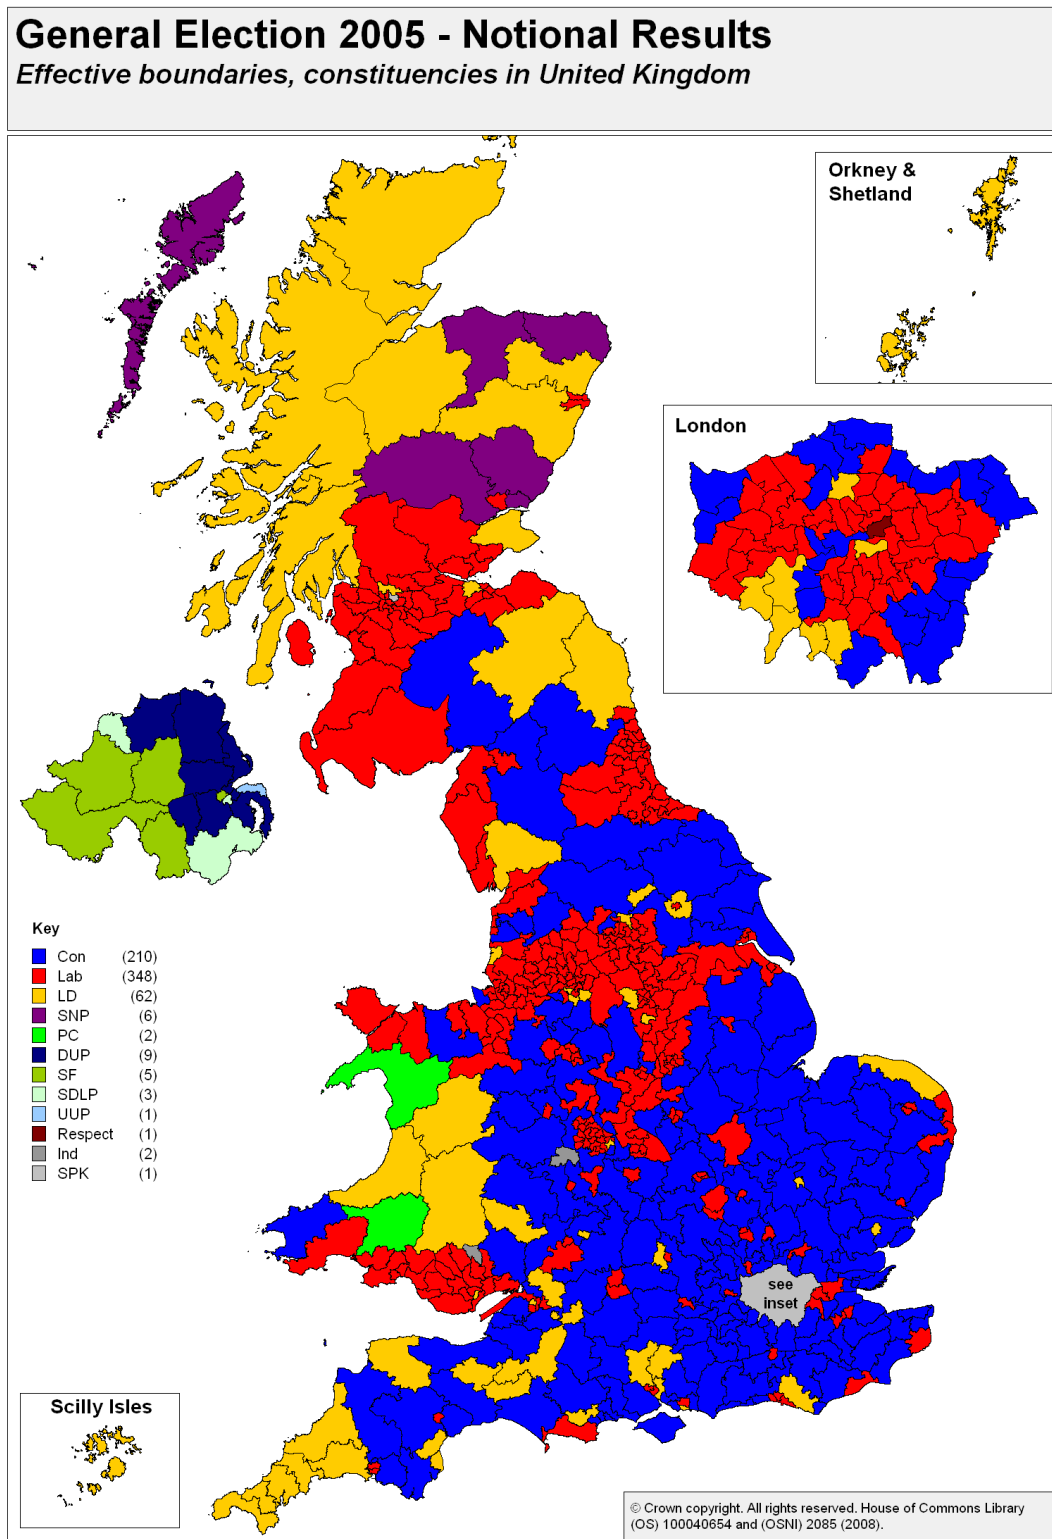

Overall the Rallings & Thrasher projections see the Labour government losing 7 seats and the Conservative party gaining 12. The Liberal Democrats remain unchanged but Plaid Cymru lose one seat.

The Boundary Review gives us 13 wholly new constituencies.

1. Broadland
2. Chelsea and Fulham
3. Chippenham
4. Derbyshire Mid
5. Devon Central

6. Filton and Bradley Stoke
7. Kenilworth and Southam
8. Meon valley
9. Northamptonshire South
10. St Austell and Newquay
11. Witham
12. Wyre and Preston North
13. York Outer

## Turnout Rates

In the UK there is no official data for turnout by age. The most generally accepted estimates for turnout by age are the ones produced by MORI's Aggregate Analysis of the election. These figures have been widely used by the Electoral Commission.

Based on these estimates the model uses these turnout rates for the 2005 election, and for practical purposes assumes there are no age-related changes in turnout for the next general election.

The MORI turnout estimates are:

The size of the eligible electorate is made through the simple calculation and inclusion of all people aged 18 or over.

The model assumes all voters are on the electoral register. As younger voters are more likely to be unregistered, if this were to be factored into the data it would serve to further increase the proportion of turnout comprised of older voters.

The analysis in this report includes a category of all voters aged over 55 and refers to this category as the "Grey Vote". This is justified because, although much research on age and voter behaviour often focuses on the post-state-retirement electorate, entirely justified and understandable considering the profound social and economic implications of retirement. However, ageing, and ageing issues do not begin to effect voters the day after retirement. They are, arguably, of life-long concern, however, in the final decade approaching state retirement age these issues become increasingly pertinent to the concerns and standard of living for voters. For voters aged over 55, ageing issues such as retirement income, age discrimination, the quality of health services, long-term care (particularly for their older parents and relatives) become increasingly important. Even if a 55 year old would not

consider themselves "old", in many ways other people and agencies have already started to treat and portray them differently.

## **Methodology**

This research is based on a model which combines data on electoral behaviour and population changes to estimate the age breakdown of turnout across constituencies for general elections in the current period. The base data for the model is the latest available Office for National Statistics population projections for 2006. These projections use the 2001 Census as a baseline and drawing on current demographic trends estimate the population changes in the last five years for each area. The data uses the new parliamentary boundaries that will be contested in the next general election of 2010.

The base data for the model is the UK Statistics Authority's 2006 sub-national population projections that update and estimate how the population of the country has changed since the 2001 Census. For specific local data in Wales the research uses statistics produced by the Statistical Directorate of the National Assembly for Wales, and for Scotland the General Register Office.

The report took this data to show the age breakdown of the turnout at the last general election in 2005 based on the new constituency boundaries.

A key problem in conducting research that it is primarily concerned with the changing demographic characteristics of Westminster constituencies is that for future projections the ONS only produces data based on local authorities. ONS produce data for the current period for the new seats, but they do not produce data for these seats projected into the future. However, the data does exist at local council level, and can be translated across, although this is a fairly time consuming process. But once completed, this research is in a position to produce incredibly interesting and useful information on the future UK electorate that is not easily available elsewhere.

To calculate the changing age profile of seats in the future the following process was used.

The ONS' sub-national projections for future population change by local authority was used as a starting point.

Each seat was cross referenced with its ward composition to see it was wholly within one local authority area or whether it stretched across two or more.

Where a seat was co-terminus with a local authority the percentage change in the age profile of the electorate in the local authority area was calculated

and then applied to the base 2005 age profile of the Westminster constituency – and turnout rates applied accordingly.

Where a seat's boundaries ran across more than one local authority area an estimate was made of the proportion of voters in the seat living in the different local authority areas. If this proportion was significant a qualified rate of change was calculated. In some cases where only one ward was located in a second local authority area the dominant local authority's data was used without qualification.

## The 2005 General Election

Overall at the national level for Britain there are only some moderate changes from the estimates for 2005 made in the last report.

The table below shows the estimated age-breakdown of turnout of the 2005 general election. The table shows that the 65+ vote is almost identical to the previous research report published in 2004 based on earlier ONS estimates, but that the 55+ has increased by 1.4% in this short time period - as the first cohorts of boomers move into near-retirement:

Table: Estimated age breakdown of turnout in the 2005 General Election

	<b>18-24</b>	<b>25-34</b>	<b>35-44</b>	<b>45-54</b>	<b>55-64</b>	<b>65+</b>	<b>All 55+</b>
<b>GB (not inc NI)</b>	7.1	13.3	19.4	17.5	17.5	25.1	42.6
<b>England</b>	7.2	13.5	19.6	17.4	17.4	24.9	42.3
<b>Wales</b>	7.2	11.3	17.8	17.4	19.0	27.4	46.3
<b>Scotland</b>	7.0	12.3	19.3	18.5	17.7	25.1	42.9

### Election 2005: Voters aged over65 –

A headline finding is that it is now estimated that “pensioners”/voters aged 65 and over GB accounted for over half of the votes cast in three parliamentary seats (Christchurch, Clacton and New Forest West). This research has based its estimates on the latest 2006 ONS estimates (within 12 months of the election), and shows a significant increase from the estimates for the oldest seats used for the 2004 report which were based upon the 2001 Census figures (a full five years before the election). The combination of using the latest ONS estimates and the effect of the boundary changes (For example,

the population covered by Christchurch's boundaries have changed by nearly a fifth) result in a significant increase in the age profile of a range of seats.

While the *oldest* seats are now in the position of holding pensioner majorities there is strong evidence of a much wider impact of retired voters on the social personalities of parliamentary seats. 287 seats in Britain are now estimated to have a third or more of votes cast by people aged 65+ and only in 45 urban constituencies is the 65+ vote lower than a quarter of turnout.

The table below shows the 40 seats in mainland Britain estimated to have the highest proportions of voters cast by people aged 65+ in 2005.

Although the south coast and the South West dominate the very *oldest* seats, note how there is a wide geographical spread in this chart of 40 constituencies. Labour hold five seats in this list which are particularly vulnerable to swings to the Conservative Party, and there are several seats which are keenly contested between the Conservative and the Liberal Democrats:

**Table: The 40 seats with the highest proportions of turnout comprised of voters aged 65 and over in the 2005 general election**

Parliamentary Constituency	% turn 65+	2005 Result	2005 Maj	Region

### The Grey Vote: Voters aged over 55

As with the data on voters aged over 65, the headline results show that in the oldest seats there has been further ageing since the 2004 estimates. Voters aged over 55 –or the “grey vote” – are now estimated to have accounted for more than two thirds of votes in four constituencies.

In the previous research it was estimated that in the 2005 general election there were 24 seats with a “grey majority” i.e. over 50% of votes cast on polling day came from the grey vote. The previous section tells us the model estimates there are three seats with a majority of voters aged 65+, and the results from this projection are now estimating there were 268 seats in mainland Britain with grey majorities. The table below shows the 40 seats with the highest proportion of turnout estimated to be made up of people aged 55+:

<b>Parliamentary Constituency</b>	<b>% 55+ turn</b>	<b>2005 Result</b>	<b>2005 Maj</b>	<b>Region</b>
<b>Christchurch</b>	69.8	<b>Con (n)</b>	14234	S.West

## Election 2010

As should be expected the projected results for a general election in 2010 reveals a step growth in the size and influence of the grey vote.

### Election 2010: Voters aged 65+

As reported in the previous section it is estimated that on the new parliamentary boundaries there were three seats in 2005 with a majority of votes cast by persons aged 65 and over. In 2010, another two seats (Worthing West and Norfolk North) move past this stage post in the age-transformation of the electorate. On its own the results concerning voters aged 65 and over are quite striking. In a 2010 election it is estimated that 102 seats in mainland Britain will have 40% or more of turnout comprised of voters aged 65+, and to demonstrate the breadth of the impact – 368 seats will have at least one third of turnout comprised of voters aged over 65.

**Chart: The 50 seats with the highest proportion of voters aged 65 and over at a general election held in 2010.**

Parliamentary Constituency	2010 % turn 65+	Winner	2nd	Majority	Majority (%)

Previous reports have discussed the concept of the wider grey vote, as well as the emergence of Grey Majority constituencies – i.e. where over half of turnout is comprised of the grey vote.

This new research now estimates that in 2005, on the new boundaries, there were 268 seats in mainland Britain that held grey majorities. In 2010 the number of grey majority seats is estimated to increase to 319, meaning that in 2010 most seats in Britain will hold a grey majority.

Regionally, perhaps, despite some stereotypes, these seats are not all to be found in the south west and the south coast as 18 of the 50 *oldest* seats are to be found in the midlands, north and Wales

**Chart: The 50 seats with the highest proportion of voters aged 55 and over at a general election held in 2010.**

## Election 2010: The Grey Battleground

For many campaign strategists and national media there is particular interest at general elections in seats that may change hands, either because they have narrow majorities, or because of some other factor such as a high profile or controversial independent candidate. If the projections are filtered to look at grey majority seats that are also highly marginal we generate an important list.

For an election in 2010 the data suggests there are 46 grey majority seats in mainland Britain where the notional majority within the new boundaries is very marginal i.e. a winning majority of five per cent or less. Of these 46 seats 14 are held by Labour, 9 by the Liberal Democrats, 1 by the SNP and 22 by the Conservative Party.

**Chart: The 46 highly marginal seats with a majority of grey voters (turnout) at a general election held in 2010.**

<b>Central Devon</b>	58.6	<b>CON</b>	<b>LD</b>	2,338	5

The Government's current working majority is 62, so the loss of 32 seats would be enough to lose that majority at the next election. While clearly there will be a diverse range of seats that count as marginals, it is interesting to note that if the Labour government were to fail to retain the 36 grey marginals where it holds majorities of less than 5,000 votes, it would also fail to retain its majority in the House of Commons.

If the categorisation of the highly marginal seats is adjusted to include any seat where the majority last time around was 5,000 votes or less we see a grey battleground in 2010 of 94 seats.

Grey marginals in 2010. By winning party in 2005:

- Labour 38
- Conservative 34
- Liberal Democrat 19
- SNP 2
- Independent 1

Chart: The 94 marginal seats with majorities of less than 5,000 and an estimated majority of grey voters (turnout) at a general election held in 2010.

## The Liberal Democrats in 2010

It is also worth noting that a significant proportion of the seats that will be defended by the Liberal Democrats are to be found in this list of grey majority marginals. There are 19 Liberal Democrat grey marginals in Britain where they are defending notional majorities of less than 5,000:

York Outer	Camborne and Redruth
Romsey and Southampton North	Chesterfield
Ceredigion	Cornwall North
Cheltenham	Cheadle
Somerton and Frome	Southport
Westmorland and Lonsdale	Brecon and Radnorshire
Hereford and South Herefordshire	Truro and Falmouth
Taunton Deane	East Dunbartonshire
Chippenham	Newton Abbot
Torbay	

**Chart: In a 2010 general election 19 highly marginal grey seats for the Liberal Democrats**

## Election 2025

If we project this data forward to 2025 we can see the bigger picture of the rate of change in the age transformation of the British electorate.

The last general election in 2005 saw voters aged 65 and over go past for the first time the one in four voters mark. As we would expect this figure increases incrementally, so that by an election in 2025 over 30% of turnout will be from the over 65s. However, as the rate of ageing in Wales and Scotland is set to run faster than in England, by 2025 over a third of votes cast in Wales and Scotland will come from the over 65s. In these countries over a period 20 years the “pensioner” vote will increase from a quarter to a third.

### Chart: The change from 2005 to 2025 in the proportion of turnout comprised of voters aged 65 and over

	2005 65+	2010 65+	2015 65+	2025 65+
England	24.9	26.3	27.6	30.3
Wales	27.4	29.2	31.1	34.8
Scotland	25.1	26.7	28.3	33.0
Great Britain (not inc NI)	25.1	26.5	27.8	30.8

In terms of voters aged 55 and over we also see steady and significant changes in the size of the wider grey vote. At the last election the grey vote (all voters aged 55+) was estimated as being 42.6% of turnout. On this report's assumptions that the age difference in turnout remains unaltered this will rise to 48.9% by 2025, but the grey vote will represent more than half of the votes cast in Wales and Scotland by 2025. The concept of a grey majority that applies to so many constituencies will by 2025 apply to at least 2 of the nations that comprise the United Kingdom.

### Chart: The change from 2005 to 2025 in the proportion of turnout comprised of voters aged 55 and over

Grey Vote 55+	GE 2005	GE 2010	GE 2015	GE 2025
England	42.3	43.1	43.9	48.3
Wales	46.3	47.5	48.7	53.5
Scotland	42.9	44.6	46.4	52.4
Great Britain	42.6	43.5	44.4	48.9

Areas of the country where the grey vote will increase the most

The fastest ageing area between 2005 and 2015 is the local authority area of South Northamptonshire

Local Authority		Number of persons 2006	Number of persons 2015	Number of persons 2025
South Northamptonshire	AGES 55-64	11697	12702	16914
South Northamptonshire	65+	12309	17948	23954

Source: Subnational Population Projections 2006, ONS: Crown Copyright.

Between 2005 and 2015 the ONS is projecting that there will be over 5,000 additional people aged over 65 in the local authority area of South Northamptonshire. This translates into an increase of over 45%. As we have seen from the previous report, in some urban areas the grey vote decreases, so conversely other areas will age faster than the national average rate. In some areas such as Milton Keynes the growth in the older population is matched by general growth in all age groups. However, in others such as Huntingdon or Tamworth there are falls in the number of persons in some younger age brackets which leads to a more rapid acceleration of the rise of the grey vote in those areas.

The context for these figures are the post war and boomer generations are now retiring or becoming grey voters and their impact on the statistics is plain to see.

Someone who reaches their 65<sup>th</sup> birthday in 2010 would have been born as the Second World War ended in 1945, and at the beginning of the period that saw the first wave of the baby boom, which was followed by a second wave in the early 1960s.

Someone who attains our grey voter status of 55 years of age in 2010 would have been born in 1955.

Voters born at the beginning of the second post war baby boom become grey voters by an election in 2015. People born in 1960 will have their 55<sup>th</sup> birthday in 2015 and become by our working definition part of the wider grey vote.

But also in 2015, voters who were 18 in 1967 - the 'summer of love' – will have their 64<sup>th</sup> birthdays in 2015, joining other older members of the flower power generation who will have already retired.

If we change the focus away from the seats with the oldest age profiles, and instead focus on the constituencies where the grey vote is growing at the fastest rates are in areas not normally associated with older voters. We also see a very rapid expansion of the grey vote, not in the South West or on the south coast where we already have clusters of seats with large proportions of older voters, but instead we see a rapid expansion of the grey vote across the East and East Midlands regions as well as in parts of Scotland and Yorkshire and Humberside.

In the seats where the grey vote is growing at its fastest we can see that the proportion of turnout comprised of voters aged 55 and over is rising at well over 50% in the period between 2005 and 2025. These figures demonstrate how the electoral importance of the grey vote will spread geographically over the next 20 years.

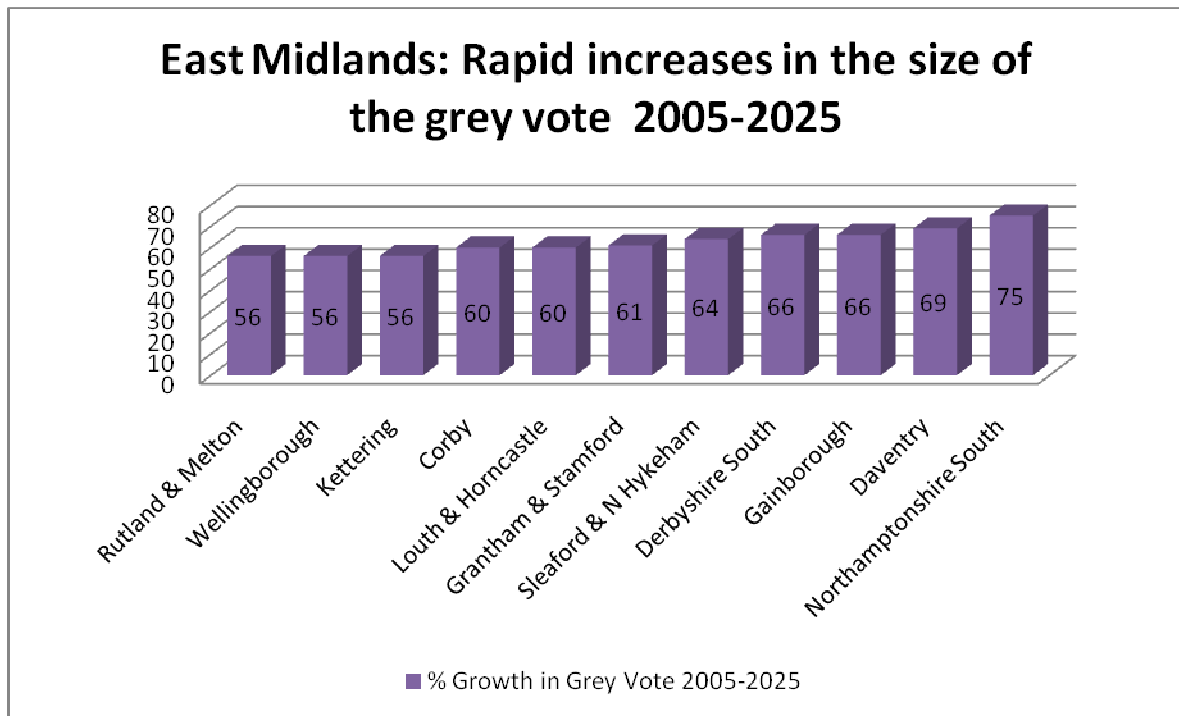

**Table: The 50 seats with the biggest rises in the number of voters aged 55 and over in the period between 2005 and 2025.**

The East Midlands region is the location of a large cluster of seats which are predicted to age much faster than other regions within Britain. So while constituencies in the East Midlands do not figure in the lists of seats with the highest proportions of older voters, it is the region that will see its age character re-orientate towards older people at a rapid pace.

**Chart: The 10 constituencies in the East Midlands with the highest rates of growth in the number of voters aged 55 and over in the period between 2005 and 2025.**

## Looking forward to 2025 – a post-age transformation electorate?

As we project further into the future we see an age composition of the electorate that is radically different from what we saw at the last general election in 2005.

Voters aged 65+

By 2015 there are now 8 seats projected to have a majority of votes cast by voters aged 65+, and this increases significantly further in 2025 to 39 seats. Although the constituencies in this list are primarily coastal, it should be noted how their distribution is more geographically widespread by 2025, with seats in the North such as Berwick-upon-Tweed, Hexham and Fylde now passing through this landmark figure.

### Seats with over half of votes cast by persons aged over 65:

Other landmarks for the persons aged over 65 category

This report has already noted the estimated majority of votes cast by people aged 55 and over in a majority of Westminster seats by 2025. At the next general election in 2010 it is also estimated that in most seats a third or more votes cast will come from people aged 65 and over. By the year 2025 466 seats will see at least one third of turnout comprised of voters aged 65 and over.

Number of seats with 40% or more aged 65+

2005 – 53

2010 - 102

2015 – 165

2025 – 294

Number of seats with a third of more of votes cast the over 65s

2005 – 287

2010 - 368

2015 – 411

2025 – 466

Chart: By an election in 2025 39 constituencies will see a majority of votes cast by voters aged 65 or over.

Parliamentary Constituency	2025 % turn 65+

## The wider Grey Vote

In 2005 there were 268 seats in Britain with a grey majority (i.e. where more than 50% of votes cast are estimated to come from voters aged 55 and over). For the next general election in 2010 this figure rises to 319, meaning that the majority of the 632 constituencies in England, Scotland and Wales will possess a “grey majority”.

Looking ahead to 2025 it is estimated that 478 constituencies will have a grey majority. In the 13 seats with the highest proportion of older voters 70% or more of turnout will be comprised of voters aged 55+. In 179 seats the grey vote will make up 60% or more of the turnout.

**Chart: The Rise of the Grey Vote 2005-2025. Seats with a majority of votes cast by voters aged 55 and over.**
